

B-Ionic Seawater System Instructions

1. Using chart below, determine the size batch you would like to make. The chart formulas produce seawater at a salinity of approximately 34 ppt (1.0256 Specific Gravity @ 77 deg. F). Due to variations in user measurement technique and moisture content of our raw materials, we recommend starting with a 10% reduction in the required amount of RO/DI water. After all ingredients are mixed and dissolved, slowly mix in RO/DI water until desired salinity is achieved as per step 7
2. With each ingredient, decide whether to use volume measurement or weight measurement. Weight measurements, using a quality digital scale, will result in more accurate and consistent batches than volume measurements. All measurements requiring scoops and measuring spoons should be level.
3. Add Sodium Chloride and mix until dissolved.
4. Add Magnesium Sulfate and mix until dissolved.
5. After being certain above ingredients are completely dissolved, add Liquid Component A and mix for one minute. Rinse measuring beaker in tap water.
6. Add Liquid Component B and mix for one minute. Rinse measuring beaker in tap water.
7. Test and adjust salinity if necessary.
8. If uncertain about adequate dissolved oxygen, aerate or circulate for one hour minimum.
